

Design-Partner Outreach Kit

Positioning, sequenced outreach templates, objection cards, and the qualification-call agenda for design-partner recruitment.

Positioning (use verbatim)

"Siliconomics is the decision system for silicon economics — deterministic, auditable program modeling for teams making \$100M+ chip decisions without \$100M of tribal knowledge."

- Computes, does not guess — deterministic engine, golden-test-locked, versioned formulas.
- Every number defends itself — sourced, dated, confidence-rated assumptions; full calculation traces.
- Decisions with a paper trail — immutable frozen Builds, content hashes, decision log.
- Programs, not snapshots — quarterly P&L, yield ramp, ASP erosion, respin risk, supply-vs-demand.

Rules of Engagement

- Personalize with THEIR program economics — lead with a modeled insight, never a feature list.
- Never claim access to foundry pricing. Our stance: public/analyst estimates shipped; their private numbers stay theirs.
- No spray-and-pray. Max 25 accounts, 3 touches each, then stop.
- Every email must be sendable in under 90 seconds of reading time.

Touch 1A — Cold email, VP Silicon / Chief Architect angle

Subject options: "Your interposer probably costs more than your silicon" / "[Company]'s chiplet math, modeled"

Hi [Name] — teams doing their first [N3/advanced-node] program usually discover late that the CoWoS interposer, not the silicon, dominates unit cost. We built a deterministic model of exactly that trade: chiplet-vs-monolithic, KGD yield stacking, packaging economics — every assumption sourced and dated, every number traceable to its formula.

We are selecting 5 design partners (6 months, free, direct founder access) whose programs face this decision in the next two quarters. In exchange: 30 minutes of feedback a week and an honest comparison against your internal numbers.

Here is a live teardown you can inspect without signing in: [demo link]. Worth 20 minutes with your program lead?

Touch 1B — Cold email, CFO / Program Director angle

Subject options: "The board deck number nobody can reproduce" / "Auditable silicon economics for [program]"

Hi [Name] — when a \$260M silicon program gets approved, can anyone later show which assumptions, formula versions, and data vintage produced the numbers the board saw? In most organizations that lives in one architect's spreadsheet.

Siliconomics freezes every approved scenario with a content hash, its exact formulas, and dated cost assumptions — a decision paper-trail for silicon programs. We are taking 5 design partners this quarter, free for 6 months.

May I show you a 20-minute walkthrough using a program shaped like yours?

Touch 2 — Follow-up (day +5)

Hi [Name] — sharing our latest teardown: a deterministic COGS model of an AI-server accelerator (4-chiplet N3-class, CoWoS-S). The interposer alone models out near \$2,800/unit — more than all silicon dies combined. Full methodology and interactive model: [link].

If [Company]'s packaging trade looks anything like this, the design-partner slot is a fit. Two slots remain for [quarter].

Touch 3 — Close-out (day +12)

Hi [Name] — closing the loop; we are finalizing the design-partner cohort this month. If the timing is wrong I will stop here — but if [program] is making its node/package call later this year, reply "later" and I will come back when the cohort reopens.

LinkedIn Connect Note (under 300 characters)

[Name] — we model silicon program economics deterministically (yield ramp, chiplet vs monolithic, CoWoS cost). Selecting 5 design partners this quarter. Your [program/talk/post] suggests this is your exact problem. Open to comparing notes?

30-Second Corridor Pitch

"Every chip company runs its billion-dollar decisions on one architect's spreadsheet. We built the audit-grade version: deterministic silicon economics — yield, chiplets, packaging, quarterly P&L — every number traceable to a sourced assumption and a versioned formula. Free demo runs entirely in your browser; nothing leaves your machine. Want the link?"

Objection Cards

Objection	Response
"Our spreadsheet already does this."	Can it show an auditor which formula version and data vintage produced the number your board approved last March? Frozen Builds + provenance can.
"Your cost numbers cannot be right — you do not have our foundry pricing."	Correct, and by design. Every assumption is sourced, dated, confidence-rated — and editable. Load your NDA numbers locally; we never see them. The model, not the constants, is the product.
"Is this AI-generated?"	No. Deterministic, test-locked computation. The AI advisor only reads results; it never produces numbers.
"Security? You want our unannounced chip specs."	Demo mode is fully local — zero transmission. Hosted mode is tenant-isolated with documented data handling. Happy to route our data-handling one-pager to your security review.

Qualification Call Agenda (30 minutes)

- 0–5 min: their program — decision, timeline, who signs off. (Confirms gates G1/G2.)
- 5–15 min: live model of a program shaped like theirs — end on the explainability panel and audit export.
- 15–22 min: partnership terms — what they get, what we ask (weekly 30 min, monthly exec review, validation comparison).
- 22–27 min: their objections; use cards above. Confirm gate G3.
- 27–30 min: next step — named sponsor, term-sheet outline sent same day, start date proposed.

The one metric to establish on the call

"Success for both of us is one thing: a Siliconomics Build cited in one of your real gate reviews. Fair?"
